

TC Centers API Documentation

Adrien Pyke

2018-06-11

1 Setup

1. Install `node.js`. The project requires version 8.0 or later.
2. Open a command prompt, and navigate to the `tcapi` folder. (`cd /path/to/folder/tcapi`)
3. Run the command `npm install` to install the dependencies.
4. Run the command `npm start` to start the server.
5. Access the API at <http://localhost:8080/tcapi/centers>.

2 Tips

2.1 Run on a different port

By default the server runs on port 8080, but if you'd like to change that, you can open `.env` and change the value of `PORT`.

2.2 Reset the Database

If you'd ever like to reset the database to it's initial state, open a command prompt and run `node seed.js`.
